

# Agua Viva

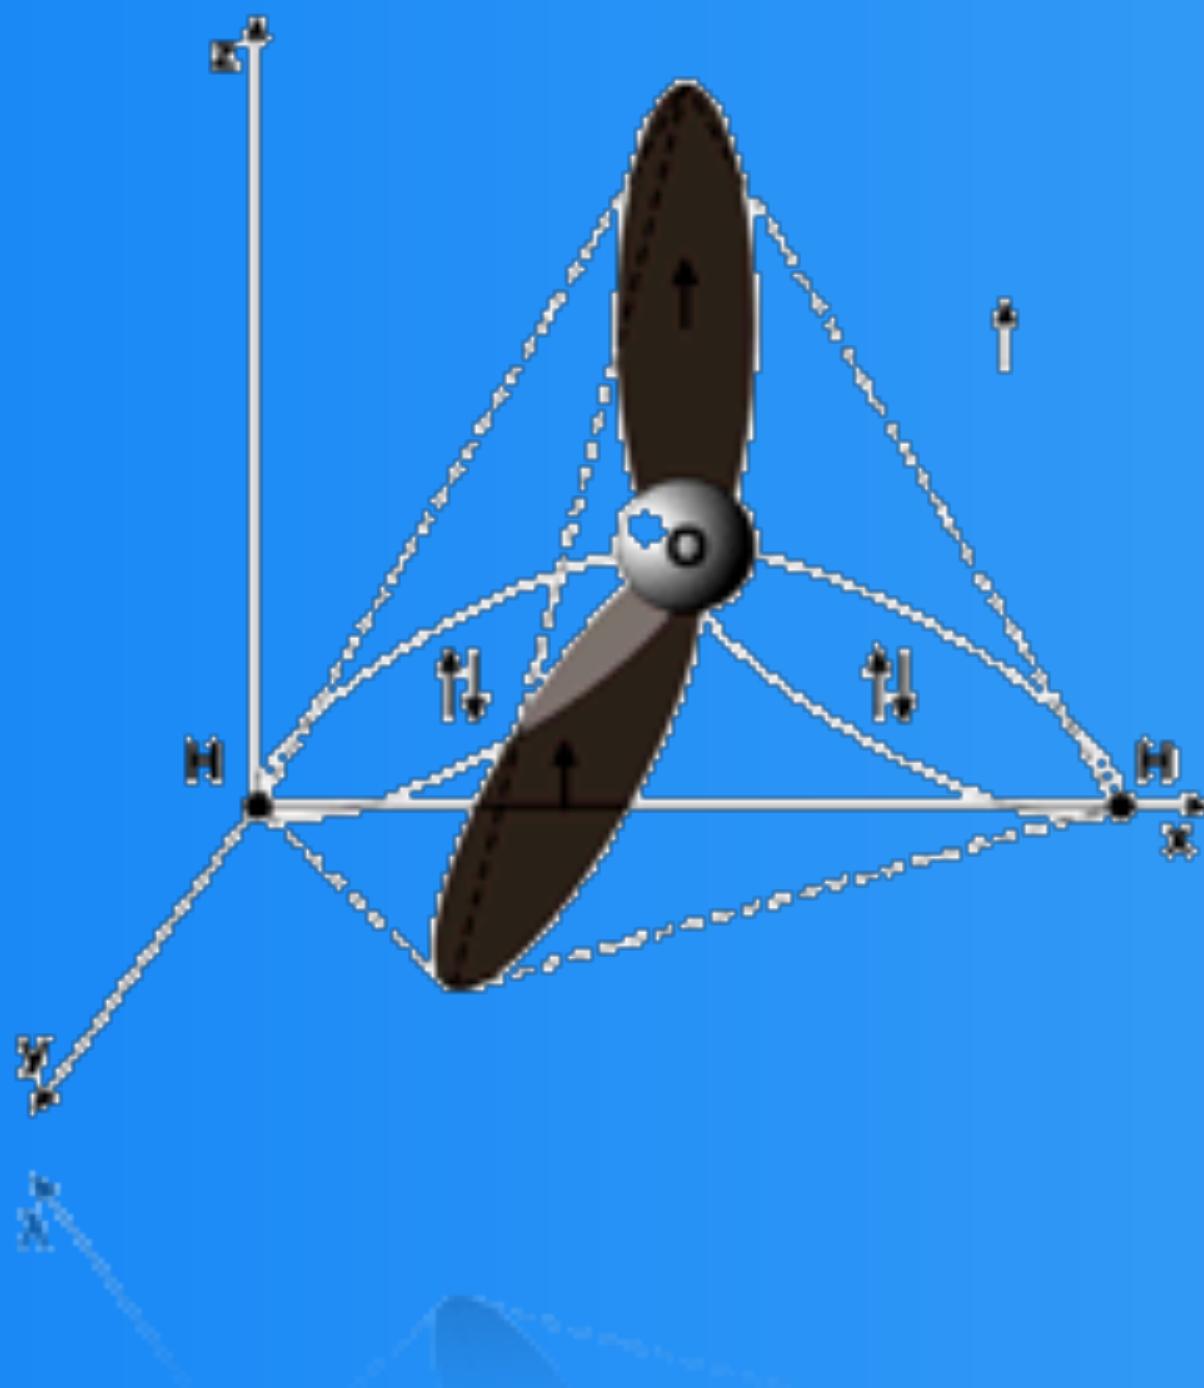

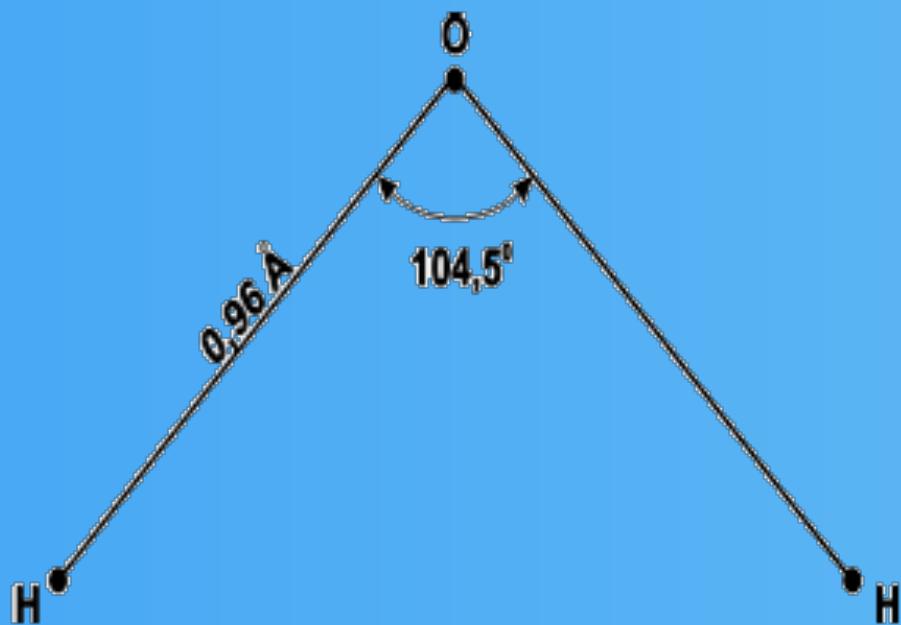

Life in a glass of water  
Health in a glass of water  
Liquid youth

This is a short presentation on the effects of structured water on living organisms and its role in life processes. We will also reveal how to obtain this water and of course we will talk about the commercial potential of this wonderful and simple product.

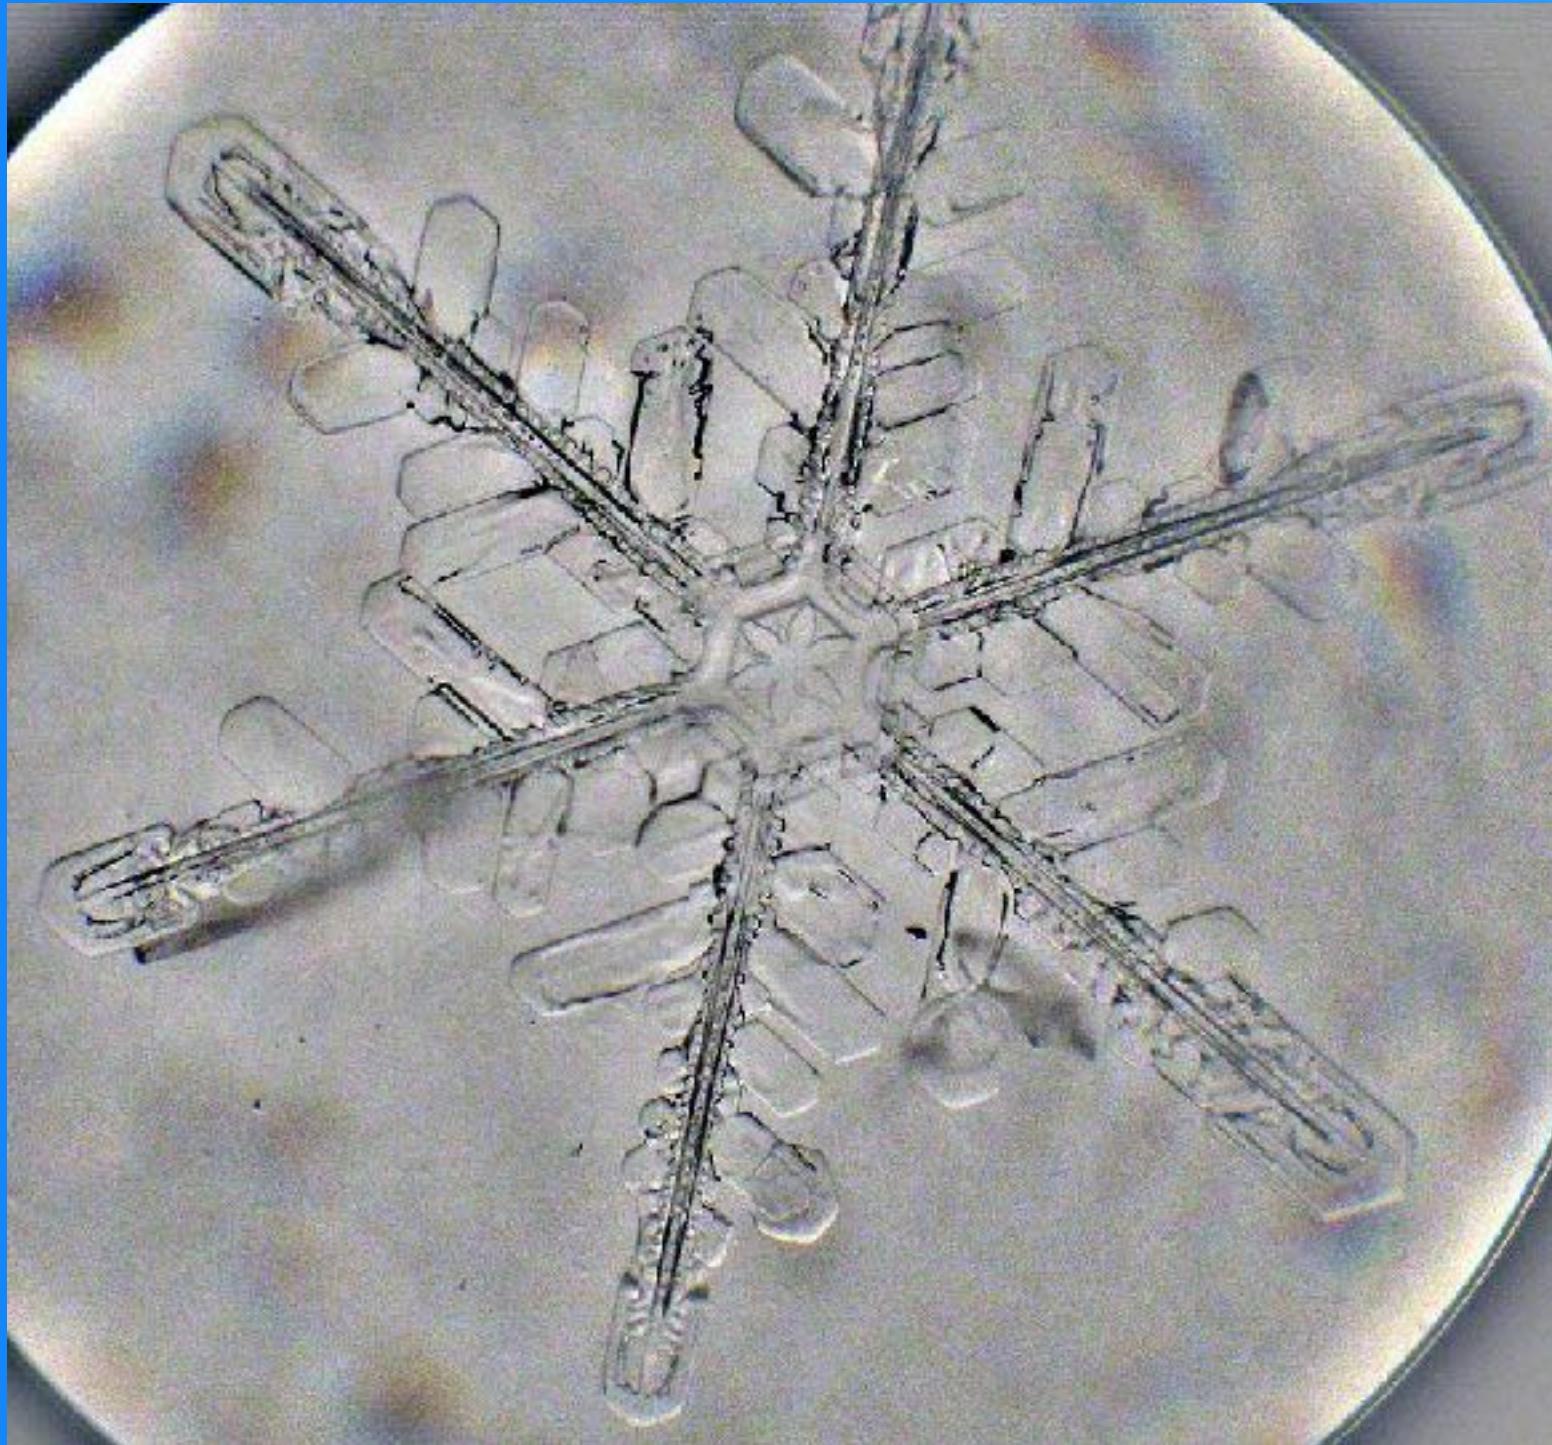

The water molecule, made up of two hydrogen atoms and one oxygen atom, has the structure of an isosceles triangle, oxygen occupies the upper part of the triangle and two hydrogen atoms meet at the base of the triangle, the angle of the triangle is  $104.5^\circ$ , the distance between oxygen and hydrogen is  $0.96 \text{ \AA}$ .  $1 \text{ millimeter} = 10,000,000 \text{ angstroms}$ .

in three-dimensional space, a water molecule can be represented as a tetrahedron, in the center of which there is an oxygen atom, and at two vertices - by a hydrogen atom

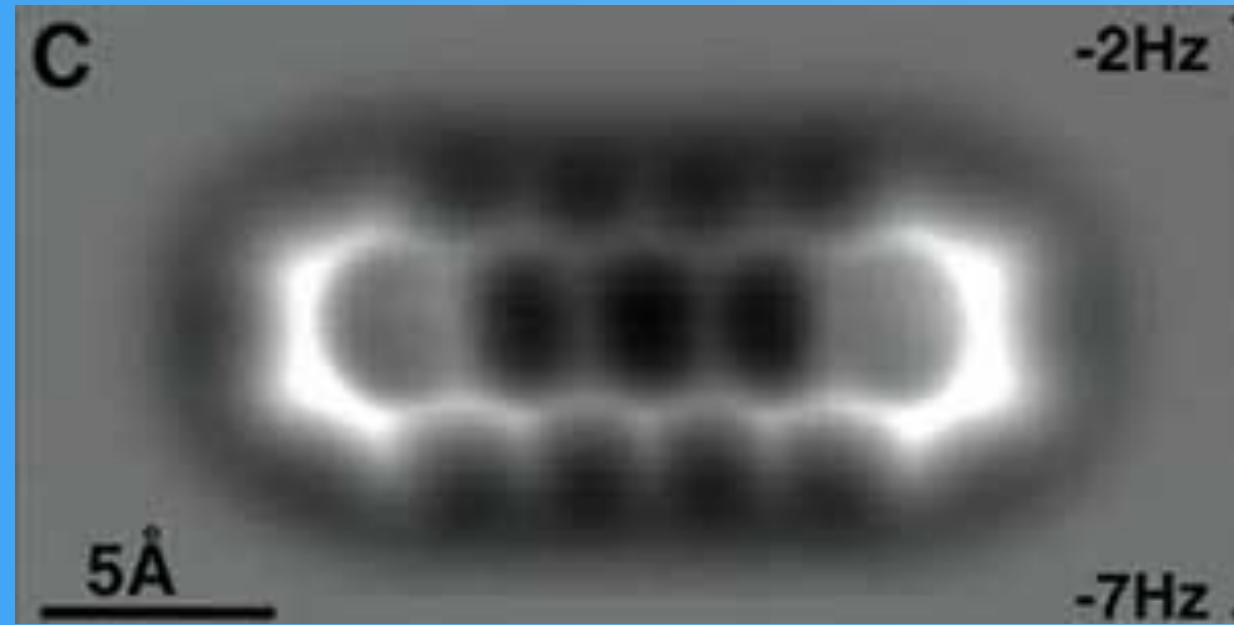

Thus, if we take hydrogen and oxygen atoms as homogeneous structures (which of course they are not, but more on that later), using electron microscopy, it can be seen that a water molecule is empty in 70% of its volume .

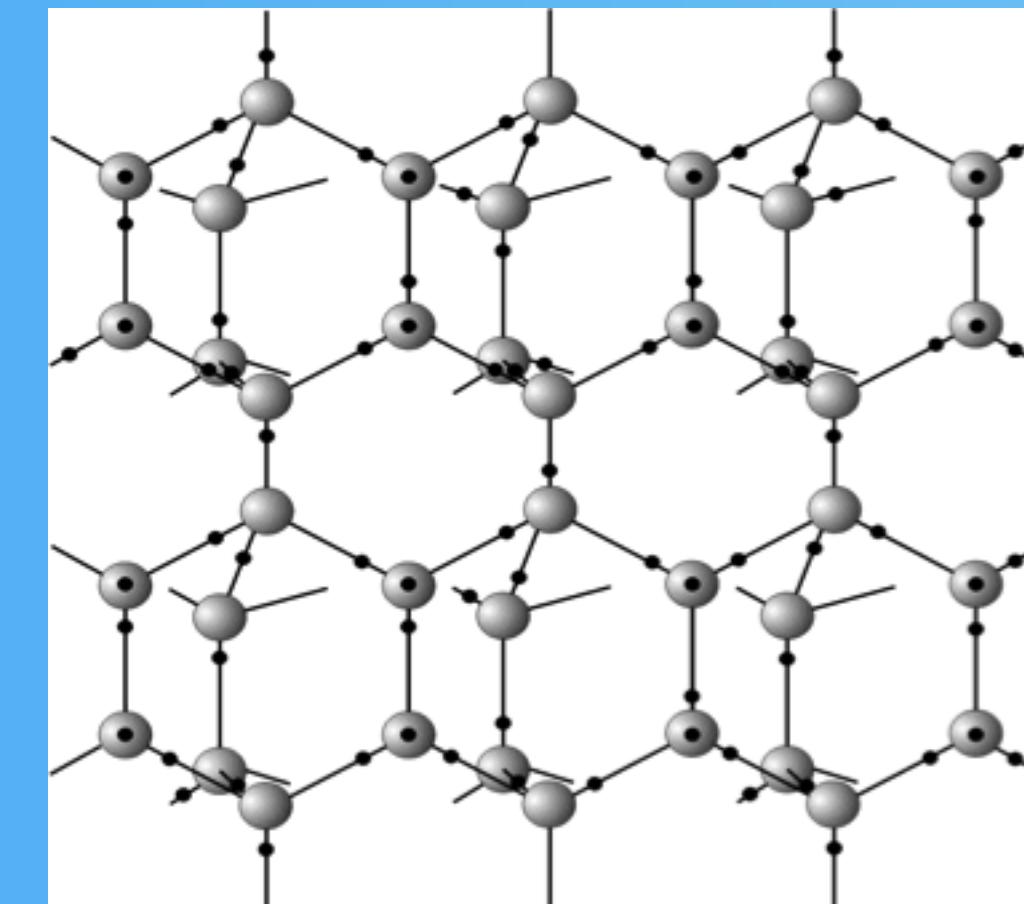

An even more vivid image is visible with conventional microscopy

The structure of ice is shown

We try to influence the voids from 70% of a water molecule. And this led to incredible discoveries.

This can be seen more clearly with ice electron microscopy.

As you may recall from the chemistry course, water is a participant and a medium for a chemical reaction.

Water is 65 to 85% part of the human body

Water is part of the tissues, without the normal functioning of the body, the implementation of the metabolic process, the maintenance of thermal balance, the removal of metabolic products, etc. it is impossible. Dehydration of the body in only a small percentage leads to the disruption of its vital functions. Lack of water during the day (especially in hot regions) already negatively affects a person's morale, reduces his fighting ability, volitional qualities, and causes rapid fatigue.

The loss of a large amount of water by the body is dangerous for human life. In hot regions without water, a person can die in 5-7 days, and without food, in the presence of water, a person can live for a long time. Even in cold areas, a person needs around 1.5-2.5 liters of water per day to maintain normal working capacity.

The amount of water needed to maintain normal water balance in the body.

Average air temperature, ° C Minimum water demand, liters

32	3
26	1.9
21	1.5
15	1.4
10	1.3
4	1.2

If the amount of water a person loses reaches 10% of body weight per day, there is a significant decrease in working capacity, and if it increases to 25%, this usually leads to death. However, even with a large loss of water, all disturbed processes in the body are quickly restored if the body is replenished with water to normal. Knowing the signs that indicate a lack of water in the human body, you can roughly determine the percentage of dehydration in relation to body weight.

Signs indicating lack of water in the human body: 1-5% - thirst, malaise, slowness of movement, drowsiness, redness in some places of the skin, fever, nausea, indigestion; 6-10%: shortness of breath, headache, tingling in the legs and arms, lack of salivation, loss of ability to move and impaired speech logic; 11-20%: delirium, muscle spasms, swelling of the tongue, hearing and visual deafness, cooling of the body.

Different parts of the human body contain different amounts of water: the vitreous body of the eye consists of 99% water, it contains 83% in the blood, 29% in adipose tissue, 22% in the skeleton and even in tooth enamel -0.2%.

Water with dissolved organic and inorganic substances is necessary for the vital activity of cells. It constitutes 80% of the weight of a child and 70% of the weight of an adult. Some of it is found inside cells and is called intracellular fluid. About 30% of the body's water is contained in the intercellular substance. This is an intercellular or interstitial fluid. Blood plasma makes up 5% of body weight (approximately 3 liters) and ensures the supply of nutrients and oxygen to the tissues, which are delivered to individual cells through the intercellular fluid.

The proportion of intercellular or interstitial fluid represents approximately 12 liters. It is an external environment for cells that extract salts, nutrients, oxygen and to which they release metabolic products.

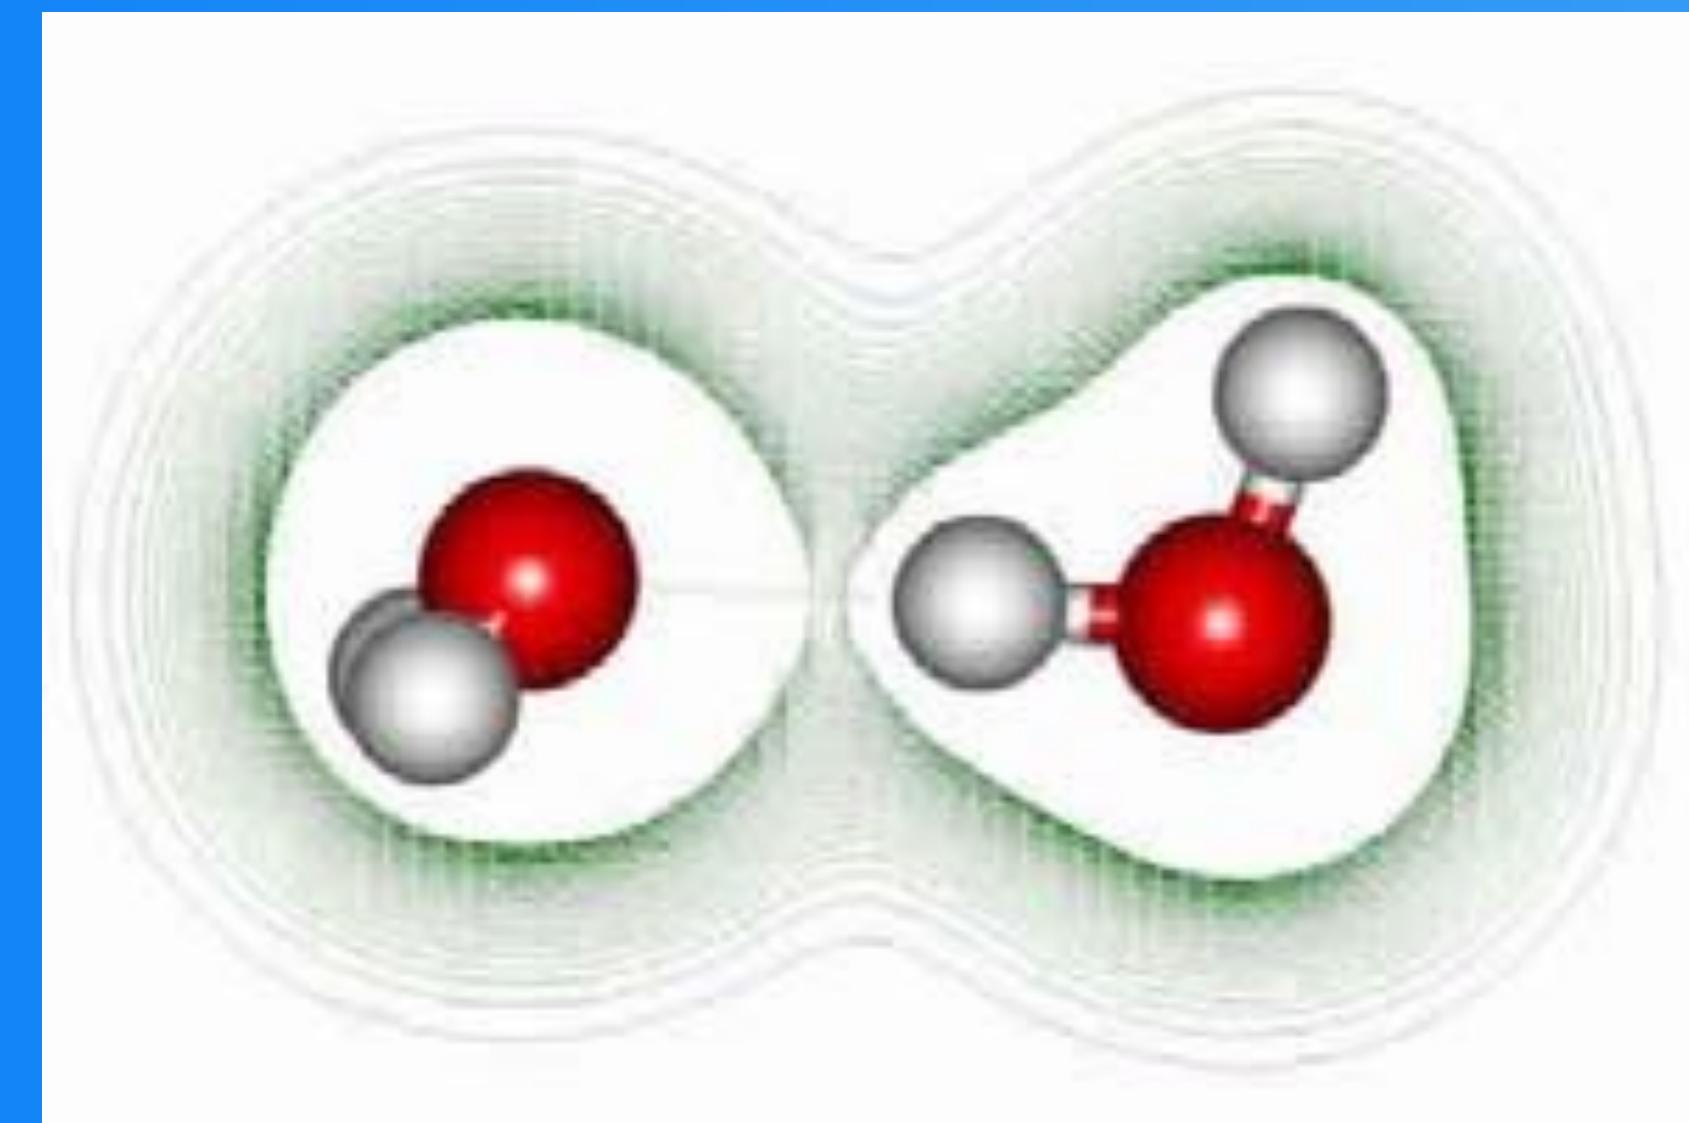

Intracellular fluid makes up about 50% of body weight. It is located inside the cells, contains electrolytes (potassium, phosphates), nutrients (glucose, amino acids) and, due to the constant enzymatic activity, ensures metabolic processes.

Therefore, it is clear that water is the main component of the human body.

Spectral analysis showed that water is an open and self-organizing system. (1995, Professor Antonov and Glybov, RAS USSR) The groups of water molecules are the smallest and most unstable self-organizing systems in nature (2005, Professor Ignatov, Russian Academy of Sciences). Changes that occur in water groups as a result of external influences can be relatively stable over time. The more information about the physical or chemical exposure factor in the cluster, the longer it is stored. This is how relatively stable self-organizing structures are created that can be carriers of future information about living matter.

The restructuring of water molecules occurs as a result of external influences. Upon receiving a charge of energy, they transfer information about their new state to neighboring molecules through hydrogen bonds. This happens according to the resonance principle (2002, Professor Zenin, RAS of Russia; 2005, Professor Ignatov, RAS of Russia).

Japanese scientist Emoto was able to visualize the arrangement of water molecules in groups by freezing water using different types of exposure. The frozen water crystals line up in a certain way. The ice "remembers" the prehistory of the liquid phase of the exposed water. Dr. Emoto is conducting an experiment in which he acts on water at different frequencies. An interesting fact is that the higher the frequency, the clearer the resulting patterns will be. This is visible evidence that water reacts differently under different influences (2002, Dr. Emoto, Japan).

In the process of the origin and evolution of living matter, water molecules, cells and tissues exchange biophysical fields with each other (1998, Professor Ignatov, Russian Academy of Sciences). Depending on the energy states, living organisms receive energy from the environment ("release" mode) or lose it ("take away" mode) (1998, Professors Ignatov, Antonov, Gylybov, RAS of Russia). These authors were able to show that in the "back" and "remove" modes there is a redistribution of water molecules by energy. The maximum period of information stored is 4 months. The second graph shows the results of the first international program "Memory" of water (2001-2002). Por tanto, la capacidad de memoria media de una

The use of the memory function of water is also evidenced in ancient sources that relate us to magical rituals and popular witch practices. Using modern research methods and understanding the structure and meaning of the impact, we have the opportunity to understand and study ancient rituals.

Understanding these deep processes allows us to literally program the water at our discretion.

That is, in simpler words, we have the ability to restore the body of a living person from almost any initial state using structured water.

It is too early to talk about stopping the aging process, this question interests almost everyone. But we can be a creature to slow down the rate of aging. It is also possible to reduce the rate of reproduction of malignant tumors, but we are subject to cancer. It is also possible to restore the functions of the pancreas, that is, we can act actively in cases of diabetes, and this is without insulin, which is addictive.

We have conducted several hundred experiments with various water treatment plants.

I will briefly describe the structure

In the first step, we neutralize the water. Balance pH to neutral 7-8. We clean it from chemical impurities. We clean the energy structure.

Next, we gently saturate the water with silver (antiseptic) and copper ions (we increase the energy resources of the human body). At the same time, we increase the memory capacity of water.

When the memory of the water reaches its maximum capacity, we load the necessary information in the water, that is, we program the water.

Programs to increase kindness and love, increase overall positive mood, increase general tone and activity (fitness program), improve physical health, and eliminate negative emotions are now available.

The main condition for the correct configuration and reliable operation of the facility is silence, spiritual purity and mental purity of the people around you. After the exposure, the water can retain its properties for up to 1 year, provided a neutral sound tone and a cool temperature are maintained. Avoid exposure to bright light or flashes of light, as well as loud or inharmonious sounds.

A reference to the commercial potential of the finished product

The body's average need for water is about 2 liters per day.

Taking into account the conditions that are far from the ideals of human life, let us attribute to the proportion of Living Water 0.33 liters per day per person on average.

According to the 2013 census, there are 3,661,868 people in Panama. According to average estimates for 2020, Panama has a population of approximately 4,252,620.

Let's take an average budget of an advertising campaign of \$ 1,000,000 for 3 months (advertising on Facebook, Instagram, banners on the roads, promotions in stores). Let's take an average coverage of 4,000,000 people.

Therefore, at the cost of a jar of living water at the \$ 1 level, we get 120 million profits excluding monthly expenses.

Taking into account the maximum costs of production, transportation, payment of royalties, etc. at the 40% level, we have 72 million net profit per month.

## Sobre nosotros un breve trasfondo

My name is Sergey Tmenov, I am 44 years old.  
I am the author of the Agua Viva project.  
I graduated from 3 universities and many additional courses.  
In 2014 I was awarded the title of Doctor of Philosophy.  
From 1985 to 2013, with groups of fellow travelers, I tried to create a full research group with varying degrees of success.  
Having achieved some success, he devoted himself to independent research and experiments in the field of gravity, microuniverses, parallel realities, influence effects in geoactive zones, programming options for consciousness, mechanical android technologies in artificial intelligence as a basic aid but still alternative.

My name is Lidiane Goncalves Leite, I am 38 years old.  
I am the Manager of the Agua Viva project.

## Terms of cooperation assumed

It is assumed that the basis for the creation of a workshop for the production of Agua Viva will be an existing company in operation for the sale of bottled water.

Thus, we will reduce the cost of the initial search for water sources, purification and primary water preparation, and we will also be able to use an optimized distribution network of the finished product.

The completion of an existing workshop or the creation of a new one under these conditions will take an average of 1 year. Most of this time will be spent practicing and testing new water adjustment programs.

It is assumed that it will take about 6 months until the first launch of the finished product. This will be marked by the start of advertising campaigns and the start of sales.

The copyright is assumed to belong to the author of the project.

While the exclusive lifetime rights to sell the finished product are best reserved for the investor, subject to the deduction of 10% royalties from the proceeds of the sale of the finished product for life with inheritance rights.

All scientific data and materials are also supposed to be left to the author to receive more scientific awards and short publications in scientific journals. However, the exclusive use rights of all project programs for commercial purposes remain in any case with the investor.

At the time of creation and launch, as well as at any time when the direct work of the author is required in the laboratory of the workshops for the production of Agua Viva, the minimum salary of the author is accepted at a level not lower than 6,000 - 7,000 per month with an additional social package.

Project manager 6,000 - 7,000 per month with an additional social package.

The initial contract for professional services with the author of the project at the beginning and the first stage of sale is possible for a period of at least 1 year with the right to renewal, which will ensure a reliable start of sales of the finished product.
